

In 2018, we encouraged the Indian government to stop its Indian Rainforest deforestation, and they are planning to reforest with ten billion trees by 2022. We have distributed more than 15000, flyers so far in the United States about the well-documented science about Climate Change, (<https://cctruth.org/cctruth.pdf>). Based on science, we have concluded that the effort to lower the carbon footprint is misguided and ineffective. More than 2000 PhD's agree with this conclusion. The most expedient and only way to lower atmospheric carbon dioxide is to increase photosynthesis. The movie Kiss the Ground, available on Netflix or YouTube, supports our conclusion and shows how better farming methods can increase photosynthesis and lower carbon dioxide in the atmosphere.
