

- **In 2019, we sent our review** to the IPCC scientists who did *not* write the mitigation chapter. One week later, the IPCC scientist who had written the simulations was no longer accessible; his email address had become invalid. This chapter makes false statements about equilibrium and simulations, often using vague and unscientific terms. Furthermore, it states that the IPCC emissions solution has only a 50-66 percent chance of lowering CO₂. The actual number is zero because the average residence time of atmospheric carbon dioxide is more than 150 years. **No business would spend such a significant amount of money (\$2.8 trillion dollars already spent worldwide) on a project with only a 50-66% chance of success.**
